

Extreme Networks

The steadily increasing demand for connected applications drives the demand for more and better networking infrastructures. Business processes and needs are enabled by better applications, which are in turn enabled by better infrastructures. The growth of networking infrastructures has created massive complexity, resulting in increased costs and reduced performance. Conventional networking solutions do nothing to reduce complexity-they add to it.

Extreme Networks is the market leader in Layer 3 Gigabit Ethernet port shipments (Dell'Oro Group). Extreme's impressive range of award winning switches combine wire-speed gigabit-switch performance, a non-blocking architecture and Policy-Based Quality of Service to manage bandwidth and prioritise traffic.

Extreme Networks provides the most effective infrastructure for deploying applications and services.

- **Increased Performance** – by dramatically increasing the performance of networked applications
- **Simplicity** – by dramatically reducing the complexity of deployment, maintenance and training associated with using switched IP networks
- **Lower Cost of Network Ownership** – by building a more valuable network that provides superior services at lower cost

The Extreme solution includes Summit fixed configuration switches, module Alpine chassis switches, module BlackDiamond core switches and the Extreme Infrastructure and Services Management (ISM) software family, each sharing the same hardware, software and management architecture for end-to-end network-wide simplicity.

Unified Access from Extreme Networks® is the industry's most versatile solution for the integrated network edge. Using Unified Access-enabled switches (the Summit 300-48™ and Extreme's Inferno family) and Altitude 300™ wireless ports, enterprises can simplify the installation and operation of wired and wireless applications with a single "unified" infrastructure.
